

PROJECT OVERVIEW

2017/01/28
by Ivan Carlucci

This project contains a controller class with business logic and a package named “model” which has all classes to contain useful data that can be used by PurchaseController.

The approach I used was test-driven-development. I wrote test for PurchaseController and Receipt class. Tests cover all the most substantial public methods in the project.

There are three tests (input1, input2 and input3) in the PurchaseControllerTest class that can be used to prove project works. There's also a test suite (AllTests.java) to launch all tests.

Below there is a simple representation of the project with classes I used:
